

Module 14 - Course Final Project - Project Code

Start Assignment

- Due Sunday by 11:59pm
- Points 100
- Submitting a text entry box or a file upload
- Attempts 0
- Allowed Attempts 3
- Available Apr 9 at 12am - May 6 at 11:59pm

Purpose:

The last week will be devoted to the course project. The main purpose of the course project is to allow you to create more complex software that fulfills the goals that you have agreed to during the proposal phase. You will need to propose a topic, develop code to meet the proposal requirements, manage a code review, participate in other students' code reviews, and create a final report and presentation.

Instructions:

Create a program that utilizes either CUDA or OpenCL to do something novel or computationally-intensive. You should submit either a git repository that the instructor can access or a compressed file containing the code and any build material. There should be a simple set of instructions, a make file, and any Helping information/data needed to run your project.

You will need to include the zipped up code for the assignment and images/video/links that show your code completing all of the parts of your project.

Scoring:

The course project will be worth 40% of the final grade. However, these points will be spread over three different components of the final project:

- Project Code – 20% of the total grade
- Project Report – 10% of the total grade
- Project Presentation – 10% of the total grade

To submit the project report and presentation please go to the **Discussions** area of the course.
